

Saiban Tours & Travels — Website Build

Intern Assignment Brief

1. Project Overview

Saiban Tours & Travels is a Pakistan-based tour operator specializing in tours of the northern areas — Neelum, Hunza, Skardu, Fairy Meadows, Kumrat, Naran, Kaghan, Swat, and Chitral (their specialty region). The company also arranges traditional food experiences and covers local events, particularly in Chitral.

Your task is to build the company's marketing website as a **React application**. Beyond the standard marketing pages, this assignment requires you to integrate **live, open (free) APIs** so the site displays real, dynamic data rather than static placeholder content. This is the core learning objective of the assignment.

2. Learning Objectives

By completing this assignment, you should be able to:

- Structure a multi-page/multi-section React application with reusable components
- Make client-side calls to third-party REST APIs and handle loading, success, and error states
- Cache or rate-limit API calls sensibly (don't hammer free-tier endpoints)
- Present real-world API data (weather, currency, maps) in a way that's genuinely useful to a site visitor, not just bolted on
- Follow a brand identity consistently (logo, colors, typography) across a full site

3. Tech Stack

- **Frontend:** React (function components + hooks)
- **Styling:** your choice (CSS modules, Tailwind, styled-components) — keep it consistent
- **Data fetching:** `fetch` or `axios`, with loading/error UI states for every API call
- **No backend required** — all API calls are client-side, using free/open endpoints that don't require a paid key or that offer a free tier

4. Brand Assets

- Logo: green "S" road/mountain design with orange compass/plane accents, "SAIBAN Tours & Travels" wordmark
- Reference for homepage feel/slider style:
<https://tourm-react.netlify.app/?storefront=envato-elements>

5. Required Pages & Sections

Homepage

- Hero image/video slider (rotating destination shots)
- "Let's Go Together" call-to-action section
- Photo gallery
- Featured tours list (destination, duration in days, short description, price if available)
- Team section
- Customer feedback / testimonials section

Tour Detail Page

- Full itinerary, duration, destination, gallery
- **Live weather widget for the destination** (see API list below)

Destinations / Explore Page

- List of destinations (Chitral, Hunza, Skardu, Fairy Meadows, Kumrat, Naran, Kaghan, Swat, Neelum)
- **Interactive map** showing pinned locations

Contact / Plan Your Trip Page

- Contact form (no backend needed — front-end validation is enough for this assignment)
- **Currency converter widget** so foreign visitors can estimate costs in their home currency

6. Required Open API Integrations

Each of these is free, and the first three require **no API key at all**, which keeps the assignment focused on integration logic rather than credential management.

#	API	Purpose	Where it's used	Auth
1	Open-Meteo (open-meteo.com)	Current weather + short forecast for a destination, by lat/long	Tour Detail Page — "Weather in [Destination] right now"	None (fully open)
2	OpenStreetMap + Nominatim (nominatim.openstreetmap.org) for geocoding, rendered with Leaflet	Interactive map with pins for each destination	Destinations / Explore Page	None for basic tile/geocoding use (respect usage policy — cache results, don't geocode on every keystroke)
3	ExchangeRate-API (exchangerate-api.com) free tier, or Frankfurter (frankfurter.dev, fully open, no key)	Convert PKR tour prices into USD/GBP/EUR/ etc.	Contact / Plan Your Trip Page, and optionally next to each tour price	Frankfurter: none. ExchangeRate-API: free key
4	Unsplash API (source images) or your own photography	Destination photography for gallery/hero, if you want dynamically-fetched stock images instead of a static asset folder	Homepage gallery / hero	Free key (Unsplash Developer)

Interns should implement **#1, #2, and #3 as mandatory**. #4 is optional / bonus — using your own or the client's provided photography for the gallery is perfectly fine and often looks better.

Implementation notes

- **Weather (Open-Meteo):** hardcode approximate lat/long for each destination (e.g., Chitral ≈ 35.85, 71.79) and fetch current temperature + condition. Show a simple icon + text, e.g. "Chitral: 18°C, partly cloudy."

- **Map (Leaflet + OSM):** don't geocode destination names live on every render — resolve coordinates once (hardcoded or cached) and just use OSM tiles + Leaflet for rendering the map itself.
- **Currency (Frankfurter or ExchangeRate-API):** default to converting from PKR; let the visitor pick a target currency from a dropdown (USD, GBP, EUR, CNY are enough).
- Every API call must show a **loading state** and a **graceful fallback** if the request fails (e.g., "Weather unavailable right now" rather than a broken UI).

7. Non-Functional Requirements

- Fully responsive (mobile, tablet, desktop)
- Page load shouldn't block on API calls — render the static content first, then hydrate widgets as data arrives
- Consistent branding (colors/typography/logo) across all pages
- Basic accessibility: alt text on images, readable contrast, keyboard-navigable nav

8. Deliverables

1. GitHub repo with the full React app and a clear README (setup + run instructions)
2. Deployed live link (Netlify/Vercel/similar — free tier is fine)
3. A short (1 page) write-up per intern noting which APIs they integrated and any issues/limitations they hit (e.g., rate limits, CORS)

9. Evaluation Criteria

Area	Weight
Design fidelity to brand & required sections	25%
Correct, working API integrations (weather, map, currency)	35%
Code quality (component structure, reusability, error handling)	20%
Responsiveness & polish	10%
README / write-up clarity	10%

10. Timeline

There is no timeline, work at your own pace.
